

# Wapnö do what others only talk about

20 years of development have resulted in our own organic life cycle at the farm - sustainable future!

## WAPNÖ MEAT & CHARCUTERIE

Wapnö organic meat comes from the farm's cattle, which has been moving freely and never given antibiotics. The animals have been bred with the utmost care, which is important for flavour and quality. Our meat products are made from Wapnö organic meat.

## DAIRY FARM

The milk flows 30 metres in a tube from the cowshed to the dairy farm. We produce our dairy products carefully and with craftsmanship. Thanks to our organic life cycle, we sign our packaging with the actual milking time. That is how close the cows are!

## FREERANGE COWS

Our animals are moving freely indoors and outside during summer. The animals eat food from the farm. To achieve sustainable meat and milk, we have four different breeds. We get a natural rotation and maintain the fertility of the fields, minimise diseases and keep the landscape open. The animals contribute to biological diversity.

## SOIL, WATER AND WOODS

The farm's soil, water and woods are important natural resources. The yearly growth in our FSC certified forestry compensates for our need for paper, including milk cartons. Our water comes from Magnus Stenbock's era, artesian water with excellent quality. In agriculture, it is crucial to care for the water, a significant resource in the organic life cycle. The soil is our most important resource, and we use it responsibly so it also can feed coming generations.

## RENEWABLE ENERGY

The farm's biogas facility provides renewable energy in the form of heating, cooling and electricity. In a clever way, the manure from the cows helps cool down the milk during milking. When the milk is cooled, energy is renewed to the system through heat exchange, called 'milk heating' - the most efficient circulation in the big organic cycle.

## FARM BREWERY WITH MALT HOUSE

In our own brewery, we brew beer from the farm's water and grains, which are malted on the farm. With the whole production at the farm, we have full control of quality and flavours, from field to bottle. Our own water contains no additions.

## Food processing on our farm

Directly from Wapnö farm to your table

## ALL THIS AT WAPNÖ FARM

Wapnö has been working actively for a sustainable environment for over 20 years and during this time we have built a unique organic life cycle at the farm. Maybe that is why you can't find a similar farm in Sweden, or even in the world, today. We are going that extra mile to look after our animals, our land and consumers.

## Agriculture on our farm

Good food for you and the environment

## ORGANIC MANURE FOR OUR IMPORTANT LAND

Through the digestion process, around 40,000 tonnes of manure becomes high-quality nutrition for our fields. The organic manure is pumped to our fields via a 30-metre wide distributor, to help reduce the greenhouse effect. By doing so, we have avoided 30,000 kilometres of tractor driving each year and achieved many environmental benefits.

## VEGETABLES

With a greenhouse, plantations and an apple garden, we add to our assortment of food produced here. For our restaurant, farm shop and consumers, we offer for example tomatoes, peppers, chili, kale, cabbage, onions and apples.

## CEREALS

Our assortment of cereals contains for example wheat and malt. We add no sludge to our fields, and haven't done so for 25 years - out of principle, and to avoid risk of heavy metals, remains from medicines etc. Instead, we want to develop our own organic cycle on the farm.

## THE FARM'S FOOD FILLS YOUR PLATE -at home or here on the farm

This is where the organic cycle reaches its goal - your plate filled with food produced at Wapnö Farm. "Hereproduced" (Härproducerat) that means that primary products and refinement exist in the same spot, which reduces transport. Enjoy "Hereproduced" food at home or at our farm! Wapnö is an open farm, visited by around 60,000 people every year. Welcome!

## "HEREGROWN"

In our fields, we grow healthy food for people in the cities and for our animals on the farm. The cultivation should be done in an efficient way to minimise the use of energy.

## GREENHOUSE

We grow vegetables in soil with added nutrients from our own organic manure. The farm's greenhouse is heated with renewable energy - an important part in our efforts to reduce environmental impact and reach CO2 neutrality.

## RAPESEED GIVES RENEWABLE FUEL

Wapnö's animals are not being fed soy, as soy plantations destroy rainforests in South America. Rapeseed is what we use for our animals. It is pressed as not to give too much fat. With the bi-product rapeseed oil, we produce biofuel for our vehicles. One step closer to a fossil-fuel free company.
